

1. Programs A and B are analyzed and are found to have worst-case running times no greater than  $150 N \log N$  and  $N^2$ , respectively. Answer the following questions, if possible:

1. Which program has the better guarantee on the running time for large values of  $N$  ( $N > 10\,000$ )?

$$\begin{array}{ll} 150 * 10000 \lg(10000) & = 19\,931\,568.6 \\ 10\,000^2 & = 100\,000\,000 \end{array}$$

2. Which program has the better guarantee on the running time for small values of  $N$  ( $N < 100$ )?

$$\begin{array}{ll} 150 * 100 \lg(100) & = 99657.8428 \\ 100^2 & = 10000 \end{array}$$

3. Which program will run faster on average for  $N = 1000$ ?

That is impossible to say as I don't know the algorithm and what the average condition will be.

4. Is it possible that program B will run faster than program A on all possible inputs?

Yes, as it is possible that the execution of program B will always be terminated very early into to loop (i assume there is a loop in it).

2. An algorithm takes 0.5 ms for input size 100. How long will it take for input size 500 if the running time is the following:

1. linear – 2.5 ms
2.  $O(N \log N)$  – 3.3737125 ms
3. quadratic – 12.5 ms
4. cubic – 62.5 ms

3. An algorithm takes 0.5 ms for input size 100. How large a problem can be solved in 1 min if the running time is the following:

1. linear – 12 000 000
2.  $O(N \log N)$  –
3. quadratic – 34641
4. cubic – 4932

4. Order the following functions by growth rate, and indicate which, if any, grow at the same rate.:

$2/N$   
 $3^7$   
 square root of  $N$   
 $N$ ,  $2N/2$   
 $2N$   
 $N \log \log N$   
 $N \log N$   
 $N^{1.5}$   
 $N \log(N^2)$   
 $N \log^2 N$   
 $N^2$   
 $N^2 \log N$   
 $N^3$
